We performed CRISPRa Perturb-seq characterization of regulators of stimulation responses in ~56,000 primary human T cells, targeting 70 hits and controls from our genome-wide CRISPRa cytokine screens (Fig. 4, A and B, and fig. S17, A to C). First, we confirmed that sgRNAs led to significant increases in the expression of their target genes (fig. S17D). Next, uniform manifold approximation and projection (UMAP) dimensionality reduction revealed discrete separation of the resting and restimulated cells (fig. S17E) and showed relatively even distribution of cells from two donors (Fig. 4C and fig. S17F). Gene signatures allowed us to resolve most T cells as either CD4+ or CD8+ (Fig. 4D and fig. S17, G and H). Thus, we generated a high-quality CRISPRa Perturb-seq dataset.

Data experimento:

- ~150 sqRNA
- ~ 70 Target Gene
- ~56,000 primary human T cells

Data Loading and preprocess

Raw Data (scRNA-seq)

AAACCCACAACAAGAT-1

AAACCCACAACGGCTC-1

AAACCCACACAGAAGC-1

AAACCCACACCCTGTT-1

AAACCCACACTATGTG-1

•••

TTTGTTGGTCCAGCCA-8

TTTGTTGGTCCCACGA-8

TTTGTTGGTGAGTGAC-8

TTTGTTGGTGCAAGAC-8

TTTGTTGTCTTCGCTG-8

 $103805 \text{ rows} \times 0 \text{ columns}$

Raw data has 36755 genes and 103805 cells

Cells are identified by barcode (e.g.: AAACCCACAACAAGAT-1, AAACCCACACACGGCTC-1, AAACCCACACAGAAGC-1, etc)

The number -1, -2, etc, represent the chromium well

A chromium well refers to the microfluidic chambers in the 10x Genomics Chromium Controller that are used to encapsulate single cells and barcoded beads into individual droplets, enabling high-throughput single-cell genomics. These wells play a key role in isolating single cells, capturing their RNA, and associating it with unique barcodes for sequencing.

Gene Expression: Represent the transcriptomic profile of the cells (the genes that are being expressed)

CRISPR Guide Capture: Which sgRNAs (and therefore which genes) were targeted in each cell.
